

ABSTRACT OF THE DISCLOSURE

To provide a dual switch for selective removal of a recording medium from a compound device which is so exactly sized and shaped that the exact switching action may be assured, it comprises two switching means on a base plate and a button capable of selectively actuating either switching means to take a recording medium out of the slot. The button has resilient means responsive to removal of pressure from the button for returning to its original position. The button can be of seesaw, slide or rotary type.
